

Project Skill Level: Intermediate DIY'er

For Best Results

To promote adhesion and durability of your topcoat, use a PREMIUM PLUS® primer. Not interested in applying a primer? Consider using PREMIUM PLUS ULTRA® products - innovatively developed as a paint and primer in one.

The Window Frame

Step 1

Begin your painting project by pouring your thoroughly mixed paint into a bucket and dipping a quality 2"-2½" wide nylon/polyester brush into the paint.

TIP: When using more than one gallon of paint, combine the containers for better uniformity of color. This intermixing is called "boxing."

Step 2

With your brush, begin painting the inside frame of the window starting at the top of the frame.

TIP: To avoid drips, tap off the excess paint against the inside wall of the bucket.

Step 3

Continue until the inside frame is complete. Let it dry.

TIP: Reload the brush when necessary to maintain a wet edge.

The Window Sash

Step 1

Raise the lower sash and drop the upper sash.

Step 2

With your brush, paint the upper sash beginning with the crossbar.

**Step 3**

Continue to the lower sash beginning with the crossbar. Repeat the process with the obstructed sash areas.

TIP: Do not brush the top or the bottom edges of the window sash as they will be used to raise and lower the sash.

**Step 4**

Paint the window casing and sills. Let this dry.

TIP: For optimum results in quality of color and finish, apply a second coat.

The Window Trim**Step 1**

Starting at a top corner of the window trim, begin painting the side edge of the trim where it meets the wall. Continue until all side edges of the trim are complete.

TIP: Reload the brush when necessary to maintain a wet edge.

**Step 2**

Return to the top of the window trim and begin painting the face of the trim.

**Step 3**

Continue until the window trim is complete. Let it dry.
